

Assessment test for summer job in programming 2017

The assignment is to create a small web application, using commonly available tools and libraries. The application is simple and only has one page.

The web page should look like this:

The page lists files found in a directory, rendered in a table. You can list files in any directory you want, but should use the "ls" command to do so.

Use the following tools/libraries:

- * Web framework of your choice
- * Bootstrap HTML/CSS/JS framework (<http://getbootstrap.com/>)

(The app has no practical use.)

Send the source code in a zip-file.
